

Online Pharmacy

The site is a mirror of an online pharmacy where clients can purchase medicine. The frontend is written in HTML, CSS and PHP to link the site with the Database which is in SQL.

I will now explain the key points of the project:

1. The Database was created and manipulated in phpmyadmin because it offers a large possibility of operations.
2. As a server I used Apache.
3. The site is written mainly in HTML, PHP (to link the database to it) and CSS for the menu.
4. I chose to slice the main page in frames and to use the central frame as homepage. Here is where all the content is concentrated.

5. The Menu has 3 active buttons.
6. The Home button shows all the tables in the database. You can ADD, DELETE and UPDATE the first two tables at choice. The UPDATE feature shows you the current content and allows you to modify it.

7.The middle button loads 10 SQL Selects from which 6 are low and medium level and 4 are difficult (the last 4 precisely).

8.The Contact button redirects you to a page where you can find my contact details and send me a message via a form.

9.The banner image on the top has a hover-over efect added.

Thank you for your time and I hope you enjoyed my project
